

Bugs

- Date on homepage needs to update automatically
- Random quote should change with each refresh (this code has been written but not integrated into the project yet)
- Currently the search page has all react component created but have not yet been pushed. This will change within the week

Key React Component

EditCard: The layout and inputs for designing the cards.

PreviewSlider: renders a list of card previews to be later injected into a card component.

PreviewCard: An actual preview card used to see the front of a card.

NavBar: Used to render the nav bar (this might or might not be removed and added to each page during next phase of production).

SideBar: Renders the sidebar for the home page, easily reused on other pages.

Home: Displays a welcome message and allows the user to easily navigate around the site

Settings: Renders the inputs such as with save and cancel buttons.

Carddisplay: Renders the card being viewed in Gallery along with the name of the deck which that card belongs to.

Grid: Renders the flippable grid card display and some useful functionalities.

Contributions

Craig worked on rectifying his page and added the main components such as the edited cards. Along with this he worked on the preview Slide, PreviewCard and NavBar components. He also helped Conor with the styling bug that occurred with the card display.

Zung changed the whole UI of the settings page due to suggestions from teammates. The new layout does not have any sidebars, but she is thinking of having one. Also, she rectified her page and added settings.js (only one component could be made with the settings page).

Liam rectified his page and created a sidebar component so other teammates can easily use the same sidebar on their pages. Additionally, he wrote some Javascript to generate a new random quote each time the homepage is visited. This code has not yet been integrated into the project though.

Conor rectified the gallery page, creating the the main component for displaying a card along with the name of the deck currently being viewed. He also made changes to the css for this page, fixing a bug with the style of the carddisplay which occurred when the HTML was put into a react component.

Yifeng rectified his page and modified the components. The left scrollbar is removed, and the right sidebar is moved to the bottom of the card displays. Also by modifying the corresponding

css, now the card can be resized automatically if users resize the window. Also in the future the whole display of the grid card view will be scrollable and will be implemented by using React.

What we cut

The things that we cut were mainly extra features such as liking, sharing, friending, emailing, things that were not focused on just the cards.
